

Suvadeep Mallik

Audio Production Specialist · Speech & Data Quality Analyst

साफ़ आवाज़ और काम की आवाज़ एक चीज़ नहीं है।

Detail-oriented audio engineer with 10+ years of live production and post, 1,000+ events, native Hindi and Bengali, proficient English. This PDF is the written portfolio. Playable Hindi and English speech samples are embedded as file attachments — open the paperclip in Adobe Acrobat to listen. Browser PDF viewers usually cannot play embedded sound; the companion studio book on the web portfolio is the inline player.

The samples are native-Hindi scripts across broadcast, conversation, field talk, questions, Eastern accent notes, Hindi-English mix, and a two-engineer QC dialogue. Each take is paired with a verbatim transcript and a keep / restore / reject call — the same independent judgement used on noisy live stages.

Attached audio (Acrobat → attachments)

- hi-broadcast.mp3 — Broadcast Hindi — formal studio read
- hi-conversational.mp3 — Conversational Hindi — humanised, fillers kept
- hi-live-field.mp3 — Field / live judgement — Eastern Hindi
- hi-codeswitch.mp3 — Hindi-English technical mix
- hi-prosody.mp3 — Emotion, breath, lower energy
- hi-question.mp3 — Interrogative contour
- hi-accent-east.mp3 — Eastern Hindi ear — dialect as feature
- hi-everyday-female.mp3 — Everyday Hindi, second speaker
- hi-dialogue-qc.mp3 — Two-engineer QC dialogue
- hi-session-log.mp3 — Session slate — numbers and entities
- en-studio.mp3 — English studio read (B2+)
- en-judgment.mp3 — Ambiguous-take decision, spoken
- hi-live-field-raw.mp3 — Field capture untreated (rumble)
- hi-live-field-restored.mp3 — After a conservative RX-style pass

What the ear is for

Native Hindi, dialect range

Native Hindi and Bengali, based in West Bengal. Everyday Eastern Hindi, Bangla-timed rhythm, and Hindi–English mix. Samples are tagged for that, not flattened toward Delhi broadcast.

English B2, clear delivery

Proficient English, studio reads in this pack, ten years of client-facing technical talk.

Auditory nuance

Live critical listening as the job: intonation, sibilance, plosives, room tone, whether a take is actually usable for training.

Transcription + disfluency / prosody

Verbatim method: fillers kept (matlab, na, vo), questions tagged, affect labelled. Reduplication is intensification, not stutter.

Independent judgement on messy audio

1,000+ events with no safety net. Gold / usable-with-noise / restore / reject is how live sound already works.

Voice, production, AI-adjacent tools

Ableton production and post; iZotope RX Dialogue Isolate and Waves Clarity Vx are themselves speech-separation networks. Using them is weekly practice in the artefacts a speech-data role has to refuse.

Broadcast (gold)

नमस्कार। मेरा नाम सुवदीप मल्लिक है, और मैं पश्चिम बंगाल से एक ऑडियो प्रोडक्शन स्पेशलिस्ट हूँ। पछिल्ले दस वर्षों में मैंने एक हजार से ज्यादा लाइव इवेंट्स पर साउंड क्वालिटी का काम किया है।

Decision: keep as gold. Do not denoise. Do not enhance. File: hi-broadcast.mp3

Conversational (humanised)

अरे वो जो कल वाली टेक थी ना... मतलब माइक थोड़ा ज्यादा पास था, तो 'प' और 'ब' पे पॉप आ गया। मैंने गेन थोड़ा नीचे किया, पॉप फ़िल्टर ठीक से सेट किया, और फिर से लिया।

Disfluency tags: ना..., मतलब. Code-mix: take, mic, gain, pop filter. Decision: keep fillers. File: hi-conversational.mp3

Field / Eastern Hindi

देखो, लाइव साउंड में रूम का अकॉस्टिक सबसे बड़ा फैसला होता है। पश्चिम बंगाल में बहुत से आउटडोर प्रोग्राम होते हैं — हवा, भीड़ का शोर, जनरेटर... सब माइक में आता है। तब कतिब से नहीं, कान से फैसला करना पड़ता है।

Accent is a feature: softer sibilants, open /a/, Bangla-timed rhythm. Decision: keep accent, do not standardise. File: hi-live-field.mp3

Code-switch

Gain staging bahut zaroori hai. Peak agar minus six dBFS ke upar chala gaya to clipping ho jayega. I always leave headroom, khas kar live mein... Forty eight kilohertz, twenty four bit. Transcribe mixed; do not translate the English islands. File: hi-codeswitch.mp3

Everyday Hindi (other speaker)

सुनो, बाज़ार से धनिया और हरी मर्च लेते आना। वो वाली वाली नहीं, ताज़ी वाली। और हाँ, दही खट्टा नहीं होना चाहिए, समझे?

Reduplication वाली वाली is intensification. Decision: keep. File: hi-everyday-female.mp3

How I decide when the file is ambiguous

This is closer to a mastering listen than a typing test. Another annotator should be able to agree with the one-sentence note. If I cannot write that sentence, the label is taste, not a decision.

01 Technical first

Clip, drop-outs, 50 Hz mains, inverted phase. Broken audio is not a linguistics problem.

02 Verbatim

What was said, including matlab, vo, na, false starts, code-switch, numbers as spoken. Do not help the speaker.

03 Accent & dialect

Eastern Hindi / Bangla-timed rhythm is a label, not an error. Identify; do not rewrite toward broadcast.

04 Prosody

Question rise vs declarative fall, stress, rate, affect, breath, pause. First-class for TTS.

05 Quality class

Gold / usable-with-noise / restore / reject. A Clarity-destroyed file is not gold because it 'sounds clean'.

06 Defensible note

One sentence another listener could stand on. Same standard as a live mix call with no second take.

Restoration pair

hi-live-field-raw.mp3 adds generator rumble and band-limiting to the field talk. hi-live-field-restored.mp3 is a modest high-pass + FFT denoise + light loudness pass — not Dialogue Isolate at 100% wet. I would label the restored file usable, with a processing tag, not gold.

iZotope RX, Nectar, Neutron, Ozone

RX is spectrogram editing for dialogue, not a single denoise knob. Modules used on speech: De-hum (50 Hz India mains), De-click / Mouth De-click, De-plosive, Voice De-noise, De-reverb, De-ess, Breath Control, Spectral Repair, Dialogue Isolate for non-stationary noise (crowd, traffic, weather), and Spectral Recovery for phone/Zoom band-limits.

Dialogue Isolate is a neural net that splits voice, noise, and reverb. It fails in familiar ways: thinned consonants, musical noise, leftover tails, overlapping talkers, whispers. I use it as a first pass. The last pass is whether the person is still in the file. Over-processed 'clean' speech is a silent poison in a training set — breath, sibilant identity, and dialect cues go first. Knowing RX means knowing when not to run it.

Waves Clarity Vx, Tune, Vocal Bender

Clarity Vx does not learn a noise profile per take; Waves Neural Networks already saw a very large voice/non-voice set, which is why it runs in real time. Broad 1 keeps more than one voice; Broad 2 is more aggressive; ECO is the low-CPU dialogue net. DeReverb Pro is a separate net with dialogue vs sung-vocal models. Clarix LB is the live-broadcast sibling.

Waves Tune and Vocal Bender change pitch and formant — useful in music, a red flag on speech data. Formant shift changes who the speaker is. Pitch quantise destroys the rise a Hindi question needs. Using Clarity every week is practice in the same questions this role asks: residual noise vs dialect vs artefact.

The DAW as a speech desk

Ableton Live was the production, edit, and post desk: Arrangement View for linear dialogue, take-lane comping, fades on every join. Capture 48 kHz / 24-bit. Interface gain — never the track fader — so peaks sit around –12 to –6 dBFS. Buffer 256–512. Pop filter, 15–20 cm, 15° off-axis. Warp is for music vocals, not for 'fixing' conversational Hindi rhythm. Export: WAV 24-bit, normalize off, dither off unless going to 16-bit, mono for one speaker.

Post path: record in Live → round-trip problem files through RX → Waves Clarity only when noise is non-stationary and time is short → back to Live for assembly. Speech QC is thousands of short files; the DAW has to mark, split, rename, and bounce without ceremony. That operational taste is 'what good audio data is'.

Recording is a chain you cannot fully repair later

A thousand live events in West Bengal rooms that were never treated: wind, generators, crowd, bad mains, talent off-mic. Cardioid dynamic on a loud stage; condenser only when the room deserves it. Null aimed at the worst noise. Get closer and lower the gain before promising a plugin will save the take. Hitting 0 dBFS is not 'using the bits'; it destroys the transient that makes a stop consonant. There is no second recording of a vow or a keynote — the same discipline as refusing to pretend a ruined file is gold speech.

Sample rate: 48 kHz speech / 44.1 kHz music

Bit depth: 24-bit capture

Peaks: –12 to –6 dBFS

Working loudness: –16 LUFS integrated (speech)

True peak: ≤ –1.5 dBTP

Mic distance: 15–20 cm, off-axis cardioid

Export: Mono WAV, normalize off

Independent business owner — Audio engineer & live event management

2016 – 2026

- Professional audio production and sound quality control across 1,000+ live events over 10+ years — critical listening for clear, natural, consistent output in rooms never designed for recording.
- Independent judgement on ambiguous, time-sensitive audio: wind, generators, bad mains, talent off-axis. Consistent, defensible calls with no second take.
- Clear technical feedback to clients, vendors, and crews — the same skill as writing an audio QC note another human can act on.
- Budget, vendor, and schedule analysis — structured data habits beside the ear.

Certifications

- Claude with Google Cloud's Vertex AI — Anthropic Academy, Sep 2026. Prompting, multi-turn workflows, model evaluation.
- Tata Group (Tata iQ) — GenAI-Powered Data Analytics Job Simulation, Feb 2026.
- Deloitte Australia — Data Analytics Job Simulation, Mar 2026.
- Jio Institute — AI Foundation Course (AI Classroom, JioPC), Aug 2026.
- B.Tech, Electrical Engineering — Narula Institute of Technology, MAKAUT, West Bengal, 2012–2016.
